

Transportation Planning

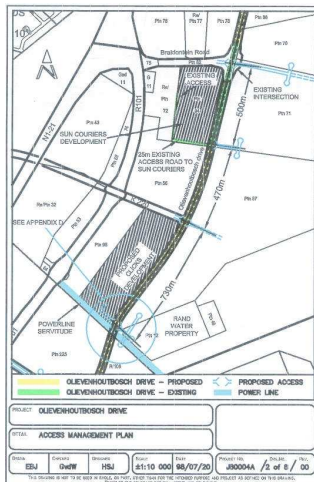

Transport studies provide the basis for appraising the total transport system and evaluating individual improvement schemes. Studies may focus on a single mode or be multi-modal, typically including local, regional and national transport. Identification of bottlenecks, assessment of management, institutional and regulatory issues and funding options are usually important components. GIBB has undertaken a varied portfolio of local, metropolitan and regional transport studies.

GIBB's experience in transportation planning and direct access to international expertise has given us unrivalled expertise to advise public and private clients on key transportation issues. We focus on the needs of our clients and perform the following studies.

- Corridor feasibility studies
- Budgeting and funding issues
- Institutions, regulatory and legal frameworks
- Traffic audits and reviews
- Integrated transport plans
- Public transport plans

Studies are supported by specialised skilled areas:

- Information management and geographical information systems
- Multi-modal modelling
- Economic and financial evaluation
- Development potential studies
- Public participation and consultation

GIBB is keenly aware that transport issues are becoming more critical in Africa and that competition for funding is increasingly difficult.
